What is a Sequence

A sequence is an arrangement of numbers in a definite order according to some rule.

3, 6, 9, 12, 15, 18, 21, ... , 24, ...

7, 11, 15, 19, 23, 27, 31, 35, ... , 39, 43, ...

1, 4, 9, 16, 25, 36, 49, 64, ...

1, 8, 27, 64, 125, ... , 216, ...

Squares of natural no.

Cube of natural no.

1^2 2^2 3^2 4^2
 1^3 2^3 3^3 4^3 5^3 6^3

3 key multiplier.
 $+3$

2, 9, 7, 4, 0, 11, 13, 19, 24, 15, ...

Q Is this a sequence?

Ans No

terms
 $2, 4, 6, 8, 10, \dots$

$2n$ $n \in \mathbb{N}$
 $a_n = 2n$
 $2n-1$ $n \in \mathbb{N}$

$a_{10} = ?$
 10th term

$a_{10} = 20$

$1, 3, 5, 7, 9, 11, 13, \dots$

First term

Sixth term

$a_n = n^2$

general term

nth term

$1, 4, 9, 16, 25, 36, 49, \dots$
 $a_1, a_2, a_3, a_4, a_5, a_6, a_7$
 Second term

$1, 8, 27, 64, 125, \dots$
 a_1, a_2, a_3, a_4, a_5
 $a = a_1$

$a_n = n^3$

$$2^{\text{nd}} \text{ term} = a_2$$

$$10^{\text{th}} \text{ term} = a_{10}$$

$$100^{\text{th}} \text{ term} = a_{100}$$

$$501^{\text{st}} \text{ term} = a_{501}$$

$$n^{\text{th}} \text{ term} = a_n \rightarrow n^{\text{th}} \text{ position par Jo term hai.}$$

#Q. Write the first three terms in each of the sequence defined by the following:

(i) $a_n = 3n + 2$

n^{th} term
(general term)

$$a_n = 3n + 2$$

$$n=1, a_1 = 3(1) + 2 = 5$$

$$n=2, a_2 = 3(2) + 2 = 8$$

$$n=3, a_3 = 3(3) + 2 = 11$$

$$5, 8, 11, \dots$$

General
term ke formula
Se aap koi bhi
term nikal sakte
hai.

#Q. Write the first three terms in each of the sequence defined by the following:

(ii) $a_n = n^2 + 1$

$$n=1, a_1 = (1)^2 + 1 = \boxed{2}$$

$$n=2, a_2 = (2)^2 + 1 = \boxed{5}$$

$$n=3, a_3 = (3)^2 + 1 = \boxed{10}$$

$$a_{50} = ?$$

$$\begin{aligned} n=50, a_{50} &= (50)^2 + 1 \\ &= 2500 + 1 \\ &= \boxed{2501} \end{aligned}$$

#Q. Write the first five terms of the sequence defined by $a_n = (-1)^{n-1} \cdot 2^n$

$$a_n = (-1)^{n-1} \cdot 2^n$$

$$n=1, a_1 = (-1)^{1-1} \cdot 2^1 = (-1)^0 \cdot 2^1 = 1 \cdot 2 = \boxed{2}$$

$$n=2, a_2 = (-1)^{2-1} \cdot 2^2 = (-1)^1 \cdot 4 = -1 \cdot 4 = \boxed{-4}$$

$$n=5, a_5 = (-1)^{5-1} \cdot 2^5 = (-1)^4 \cdot 32 = 1 \cdot 32 = \boxed{32}$$

Progression

A progression is a special type of sequence for which it is possible to obtain a formula for the n^{th} term. The Arithmetic Progression is the most commonly used sequence in maths with easy to understand formulas.

2, 3, 5, 7, 11, 13, 17, 19, 23, 29, 31, 37, 41, 43, 47, 53, ...

Q Is this a sequence?

Ans: Yes.

Arithmetic Progression

An **Arithmetic Progression (AP)** is a sequence of numbers where the differences between every two **consecutive** terms are the same. In this progression, each term, except the first term, is obtained by adding a fixed number to its previous term. This fixed number is known as the common difference and is denoted by 'd'. The first term of an arithmetic progression is usually denoted by 'a' or ' a_1 '.

7, 12, 17, 22, 27, 32, ... 37

$+5$ $+5$ $+5$ $+5$ $+5$ $+5$

Common difference = d

-6, -2, 2, 6, 10, 14, 18, 22, ...

$+4$ $+4$ $+4$ $+4$ $+4$ $+4$

Arithmetic Sequence.

general term
ka
formula

A.P

Types of A.P.

✓ **Finite AP:** An AP containing a finite number of terms is called finite AP. A finite AP has a last term.

For example: 3, 5, 7, 9, 11, 13, 15, 17, 19, 21 ...

$$\begin{aligned} a &= 3 \\ d &= 2 \end{aligned}$$

Infinite AP: An AP which does not have a finite number of terms is called infinite AP. Such APs do not have a last term.

For example: 5, 10, 15, 20, 25, 30, 35, 40, 45 ...

$$\begin{aligned} a &= 5 \\ d &= 5 \end{aligned}$$

#Q. Show that the sequence defined by $a_n = 2n^2 + 1$ is not an A.P.

$$a_n = 2n^2 + 1$$

$$n=1, a_1 = 2(1)^2 + 1 = 3$$

$$n=2, a_2 = 2(2)^2 + 1 = 9$$

$$n=3, a_3 = 2(3)^2 + 1 = 19$$

$$n=4, a_4 = 2(4)^2 + 1 = 33$$

$3, 9, 19, 33, \dots$

$\swarrow \quad \searrow \quad \swarrow \quad \searrow$
 $+6 \quad +10 \quad +14$

\therefore there is no common difference, \therefore it is not an A.P.

#Q. The n^{th} term of an A.P. is $6n + 2$. Find the common difference.

CBSE 2008

$$a_n = 6n + 2$$

$$n=1, \quad a_1 = 6(1) + 2 = 8$$

$$n=2, \quad a_2 = 6(2) + 2 = 14$$

$$n=3, \quad a_3 = 6(3) + 2 = 20$$

$$a = a_1 \quad \boxed{8, 14, 20, \dots}$$

$a_1 \quad a_2 \quad a_3$

$$d = a_2 - a_1$$

$$= 14 - 8$$

$$d = 6$$

#Q. The general term of a sequence is given by $a_n = -4n + 15$. Is the sequence an A.P.?
If so, find its 15th term and the common difference.

$$a_n = -4n + 15$$

$$a_1 = -4(1) + 15 = 11$$

$$a_2 = -4(2) + 15 = 7$$

$$a_3 = -4(3) + 15 = 3$$

$$a_4 = -4(4) + 15 = -1$$

$$a_{15} = -4(15) + 15 = -60 + 15 = -45$$

$$a_1, a_2, a_3, a_4, \dots$$

$$11, 7, 3, -1, \dots$$

Yes it is an A.P. $\rightarrow d = -4$

$$a_2 - a_1 = a_3 - a_2 = a_4 - a_3$$

$$7 - 11 = 3 - 7 = -1 - 3$$

$$-4 = -4 = -4$$

General Term of an A.P.

$$5, 11, 17, 23, 29, 35, \dots$$

$\swarrow \quad \searrow \quad \swarrow \quad \searrow \quad \swarrow$
 $+6 \quad +6 \quad +6 \quad +6 \quad +6$

First term = a .

Common difference = d .

$$a, a+d, a+d+d, a+d+d+d, a+d+d+d+d, \dots$$

$$a, a+d, a+2d, a+3d, a+4d, a+5d, a+6d, \dots$$

$a, a+d, a+2d, a+3d, a+4d, a+5d, \dots$

$a+0d, a+1d, a+2d, a+3d, a+4d, a+5d, \dots$

$$a_1 = a + 0d$$

$$a_2 = a + 1d$$

$$a_3 = a + 2d$$

$$a_4 = a + 3d$$

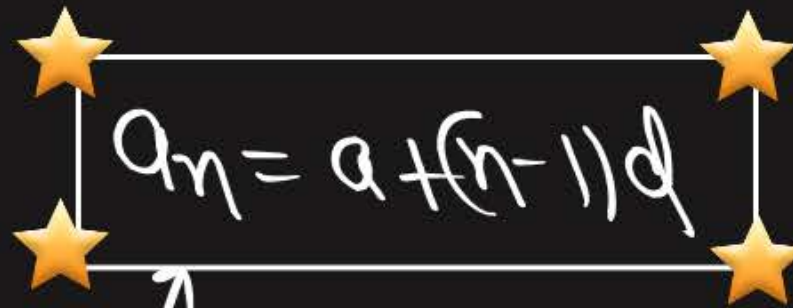

$$a_{10} = a + 9d$$

$$a_{11} = a + 10d$$

$$a_{20} = a + 19d$$

$$a_{100} = a + 99d$$

$$a_{498} = a + 497d$$

General term / n^{th} term.

#Q. Write an A.P. whose first term is 10 and common difference is 3.

$$a_n = a + (n-1)d$$

n^{th}
term.

First
term.

Common d .

$$a=10, d=3$$

10, 13, 16, 19, 22, ...

A.P.

#Q. Write an A.P. having 4 as the first term and -3 as the common difference.

$$a = 4$$

$$d = -3$$

4, 1, -2, -5, -8, ...

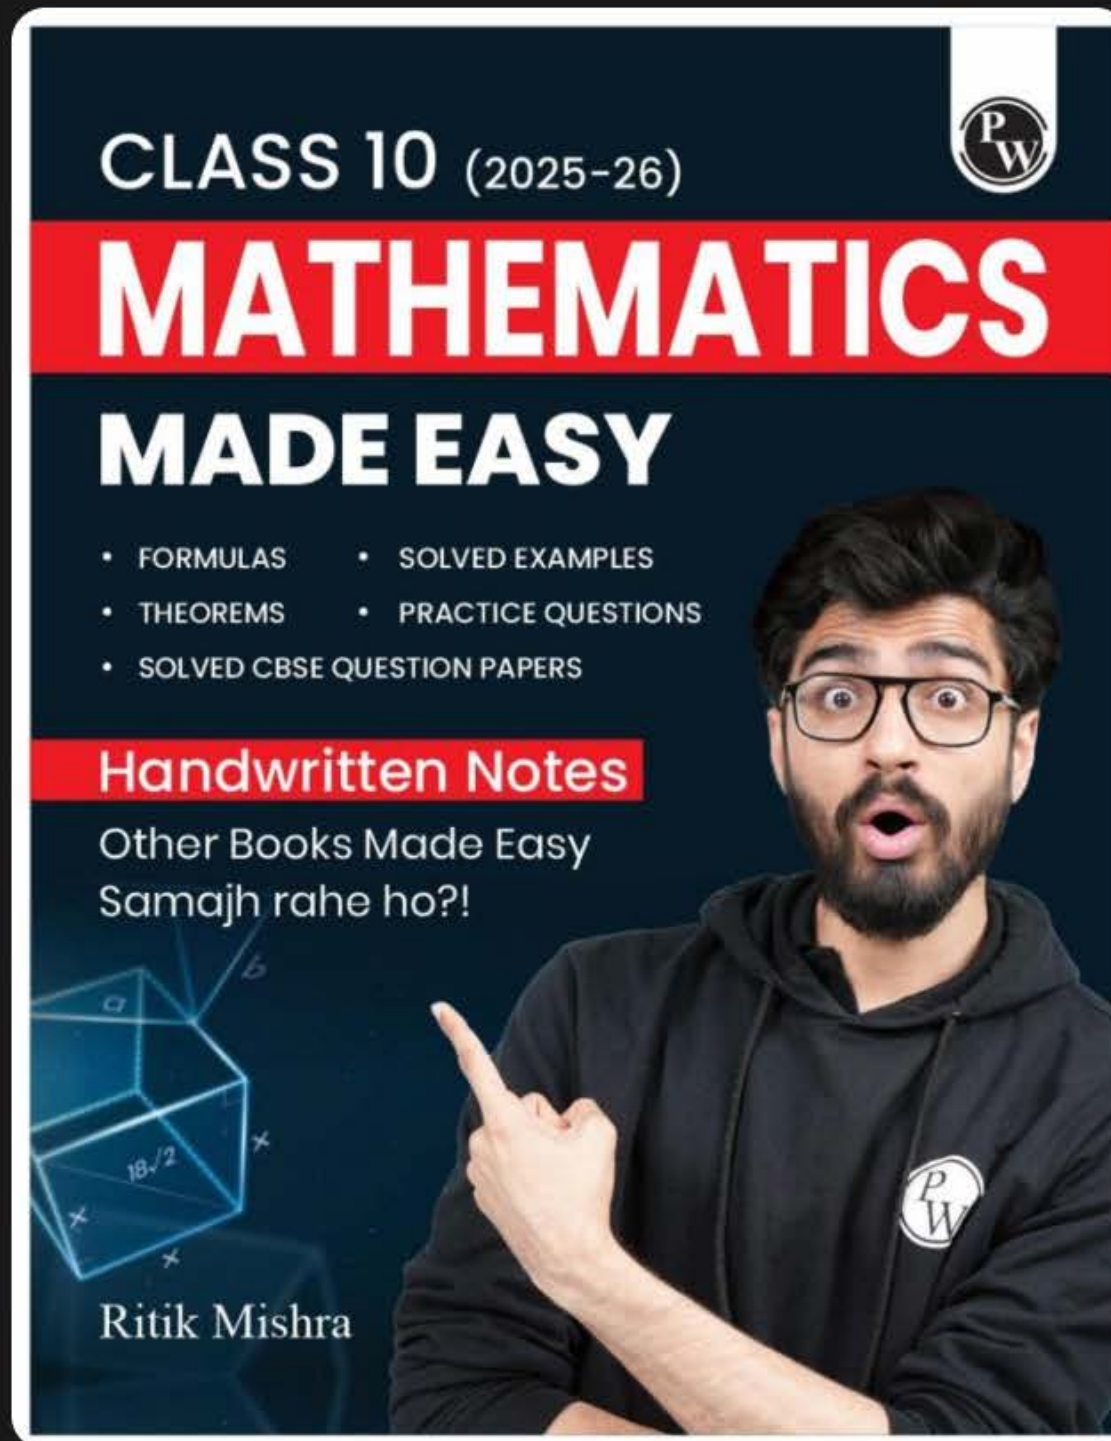

A.P

$a, a+d, a+2d, a+3d, \dots$

$4, 4+(-3), 4+2(-3), 4+3(-3), \dots$

4, 1, -2, -5, ...
